Atlas Figure 1 | Longitudinal expression trajectories of 75 genes nominally coupled to both motor and cognitive severity. Mean expression change from baseline (Δlog2(CPM + 1)) across baseline, 12-month and 24-month visits for PD (red solid line, n = 249 participants at baseline) and non-neurological disease controls (blue dashed line, n = 104). Shaded bands, ± s.e.m. Green dotted line, linear-mixed-model-estimated log2FC(PD/Control) at each time point. Each panel shows one gene. Genes were selected by a pooled-visit interaction model fitted to each of 19,030 expressed genes: expression ~ Group + Score + Group × Score + Sex + Age + brain-signature proportion + RUVs factors W1–W3 + ancestry PC1–PC3 + (1 | Participant), where Score is the z-standardized MDS-UPDRS Part III or MoCA. The 75 genes shown reached nominal P < 0.05 on the Group × Score interaction in both dimensions.
