Atlas Figure 4 | Expression versus MoCA score for 1,088 genes nominally coupled to cognitive severity. Covariate-corrected expression (x-axis, log2CPM) versus z-standardized MoCA total score (y-axis); points are observed visits (745 PD, 312 control samples). Red and blue lines are descriptive OLS fits for PD and controls, not mixed-model estimates. Each panel annotates the interaction β and nominal P value. One panel per gene, ordered by ascending P value. Genes were selected at nominal P < 0.05 for MoCA.
